

ER Diagram

1. Entity 
2. Attribute 
3. Relationship 

weak entity

Schema: Section

<u>no</u>	<u>code</u>	Room	<u>id</u>
-----------	-------------	------	----------------------

entities

1. There are two ~~attributes~~ entities: building and room. Each building has several rooms. Rooms have a room number composed of a serial number and a floor number. Each floor is in all buildings so the room number is not unique unless combined with building number.

You want to create an employee and project management system for the “XYZ” company. Construct an ER model according to the given data requirements:

- The company is organized into departments. Each department has a unique name, unique number and an employee who manages the department. We keep track of the start date of the department manager. A department may have several locations.
- A department may control a number of projects. Each project has a unique name, unique number and is located at a single location.
- We store each EMPLOYEE's social security number, name (composed of first name, middle initial and last name), address, salary, sex, and birthdate. Each employee works for one department but may work on several projects.
- We keep track of the number of hours per week that an employee currently works on each project. We also keep track of the direct supervisor of an employee.
- Employees may have a number of dependents. For each dependent, we only keep track of their name, sex, birthdate and relation with the employee.
- We also need to know the number of employees working in a department. However, this value can be calculated from counting the number from the relationship instances, therefore, this value does not need to be stored.
